

Drink & Think Technical Defense

I built Drink & Think for adults who enjoy learning, conversation, and a relaxed night out. The website has four pages: Home, About, Schedule, and Contact. Visitors can learn about the concept, explore lecture topics, review event details, and submit their reservation interests.

I used HTML and CSS, semantic elements such as header, navigation, main, and footer to organize each page. Shared CSS variables, layers, and reusable classes keep the design consistent. Responsive layouts adjust the content for different screen sizes. I chose serif headings for a professional feel/ vibe and simple system fonts for readable body text.

I included skip links, keyboard focus, labeled form fields, required-field validation, and reduced-motion styles. Important images have descriptive alternative text, while the decorative drinks illustration, gradients, etc have an empty alt attribute. Each page has a unique title, description, and canonical URL. The Schedule page also has social-sharing metadata. I deferred event structured data because the event and venue details can't be confirmed.

During the review, all four published HTML pages passed validation without errors. The navigation and selected content links worked. Contact was tested at 375, 768, and 1440 pixels without horizontal overflow. Keyboard checks showed visible focus on the tested links and controls. Submitting an empty form moved focus to the required name field. The CSS validator flagged container queries and returned warnings, which are documented in the release checklist.

I updated my local files with social metadata URLs, canonical links, a clearer Contact title and description, and a full-width mobile form button. The performance check identified the Our Story images as an opportunity to reduce file sizes. Smaller WebP copies worked in a separate review copy, but that improvement only applies to the published site if those files are added and deployed.

I used AI to help review requirements, suggest code changes, prepare image copies, run checks, and organize documentation layouts.
